

BUYING - CAVITY CLOSER SYSTEMS

Without the addition of windows and doors our modern buildings would be virtually free from damp, cold and condensation problems - although would be rather ugly and impractical! By the careful selection and inclusion of a Cavity Closer system we can maintain the performance of the insulated cavity wall by keeping the elements and their effects away from the habitable spaces within.

THERMABATE

One of the oldest names in Rigid Cavity Closers, this RMC product is still well specified and remains a popular choice for many. Dorsey are pleased to offer Thermabate, plus other, more economical Rigid Cavity Closers, enabling you to close your cavities without cutting and "returning" your blockwork - you will find we hold good stocks to suit a wide range of cavity widths, and are able to provide special widths at short notice.

WINDOW FORMERS

will provide your Cavity Closer whilst saving you the time and expense involved in making up, and later on, disposing of the traditional timber formers. Turn to pages 54-55 for full details.

DAMCOR and RUBERCLOSE

ensure that you meet the regulations by providing an insulation product (must be 18mm to meet current regs, Oct 04) bonded to a DPC. Probably the most economical option available, this has been a best seller for many years - however, the material cost is only part of the picture, with all Insulated DPC's you will still need to cut and "return" your blockwork to close the cavity.

ALREFLEX

and similar products provide an insulated DPC solution through the provision of a cold break beating cavity closer. Using the air trapping bubbles together with reflective foil film creates a flexible and effective material.
